

ABSTRACT OF THE DISCLOSURE

09/817682

An alignment mark configuration, wherein the alignment mark is protected from being damaged from the subsequent planarization process, is described. The alignment mark configuration comprises a plurality of recesses and a flat spacing between the recesses on the substrate. If the substrate further comprises a trench structure, the spacing between the trench structure and the alignment mark is at least 5 times the flat spacing between the neighboring recesses of the alignment mark.
